Drawing some Ising ground state properties for designing the Ising ansatz

- Real
- Ground state energy under overall spin-flip (charge conjugation) symmetry $\mathcal{C} = \prod \sigma_x^i \rightarrow$ can reduce rotation space
- Neighbor interaction \rightarrow can reduce entanglement map

HEP Scattering Cross Section

Theoretical expression:

$$d\sigma = \frac{1}{2E_a 2E_b |v_a - v_b|} \left(\prod_f \frac{d^3 p_f}{(2\pi)^3 2E_f} \right) |\mathcal{M}(p_a, p_b \rightarrow \{p_f\})|^2 (2\pi)^4 \delta(p_a + p_b - \sum_f p_f)$$

$|v_a - v_b|$: relative velocity (=longitudinal momentum/energy) of the beams viewed from the lab frame

p_a, p_b, E_a, E_b : initial state momenta and energies; p_f : final state momenta

$\mathcal{M}(p_a, p_b \rightarrow \{p_f\})$: scattering amplitude, $\{p_f\} = p_1, p_2, \dots, p_n$

Scattering amplitude $\mathcal{M}(p_a, p_b \rightarrow \{p_f\})$
